

## **ISO 5011 Test Results**

**Certified to the ISO 5011 Air Filtration Standard**

**Cold Air Intake Kit**

**1998-03 Ford F250/350/450  
V8-7.3L Powerstroke**

**Part Number 75-5028**

## **ISO 5011, Second Edition Air Filter or Intake Kit Test Report**

The test data presented in the following report represents the restriction of airflow, efficiency and dust loading capacity. The filters tested were procured from various distributors or provided by customers. The tests were performed in accordance with ISO 5011. The following were measured in accordance with the test: (1) Pressure Drop for Clean Element, Initial Efficiency and Dust Loading Capacity. The Flow Rate used to conduct the Dust Loading and Capacity test(s) is listed under the *Average Environmental Conditions and Test Specifications*. PTI ISO Course Test Dust was utilized and the particle data sheet for the batch is attached.

The test sequence begins with measuring the pressure drop of a clean filter as a function of the airflow rate which is measured in cubic feet per minute (CFM). Subsequently, the cumulative efficiency and dust loading capacity are measured. The termination point when measuring for capacity is shown at the bottom of the report under the heading *Termination  $\Delta P$* . The results of the tests are recorded in the top table and charts shown on the next page. The filters are inspected before and after the tests are performed.

The Top Table demonstrates the results of the testing for up to three (3) samples per filter type (part number). The Efficiency represents the amount of dust (contaminants) that was stopped by the filter during each test. The Capacity measures the dust holding capability of the filter.

During the test, the filter is loaded with dust until it reaches a terminal pressure drop increase of 10 inches of water (28" H<sub>2</sub>O for Heavy Duty Vehicles) across the filter element (please refer to the Average Environmental Conditions and Test Specifications at the bottom of the next page to verify the pressure drop utilized on this particular test).

The Line Graph shows the pressure drop as a function of the airflow rate for the clean filter(s). The computer controlled test equipment initiates the test at close to zero (0) cubic feet per minute (CFM) and then increases the CFM gradually until the CFM termination point is reached. During the test, the restriction of the filter is measured in inches of water ("H<sub>2</sub>O) as it relates to the air flow rate (CFM). Visual inspections of filters are performed to insure against dust leakage and manufacturing flaws.

The Bar Graph illustrates the cumulative efficiency for the filter(s) tested.

### **Definition of Terms & Test Protocol**

#### Restriction

Restriction measures how difficult it is for the air to get through the filter and is measured in inches of H<sub>2</sub>O. Instead of referring to restriction, the industry uses "air flow" to describe the effect of restriction. They say for example, that a High Performance Filter "flows better" than the OEM paper filter. On a line graph, the lower the restriction of a filter the better the air flow.

#### Efficiency

Efficiency is measured in % and is the amount of dirt/contaminants that the filter stops from going into the engine.

#### Capacity

Capacity is the total amount of contaminants/dirt the filter will hold before reaching its termination point. The termination point is a predefined restriction point that is used as the cut-off point when measuring how much dirt a filter will hold. For typical vehicles, 10" H<sub>2</sub>O is used at the termination point. For heavy duty trucks, this number is 28" H<sub>2</sub>O.

Note: Testing was conducted based on the ISO 5011 testing standard; however, variances from the actual test procedures may exist. The intent of the testing is to show comparative test results between various products that are intended for similar use. Tests are conducted under a climate controlled environment; however, changes in temperature and humidity between tests may occur which could alter the actual test results.

**ISO 5011 Air Filtration Test Air Flow Summary**

99'-03' Ford F-Series 7.3L Diesel

**S&B Filters Part Number 75-5028 (Prototype) Flows:**

49.9% Better than OE at rated CFM

49.6% Better than OE Across CFM Spectrum

#### AVERAGE ENVIRONMENTAL CONDITIONS & TEST SPECIFICATIONS

Temperature:	71.71	deg F
Relative Humidity:	50.82	%
Baro Pressure:	28.93	mmHg
Test Stand:	#1	
Inlet Size:	3.75	inches

Housing:	OE/ Uni con.	
Contaminant:	Coarse	
Contam. Lot #:	5410C	
Dust Feed Rate:	17.67	grams/minute
Rated Flow:	631	cfm

Testing was conducted based on the ISO 5011 Air Filtration standard.

## Determination of Gasoline and Diesel Engine Air Consumption

### CFM Calculator: Enter Data in Blue Shaded Areas

Engine Displacement (cubic inches)	445.4
RPM at maximum horse power	2,800
Cycle Factor:	2
Enter "2" for 4 Cycle Diesel and Gasoline	
Enter "1" for 2 Cycle Diesel and Gasoline	
Volumetric Efficiency:	1.75
Naturally Aspirated Gasoline & Diesel Engines Enter "0.8"	
Super Charged Diesel Engines Enter "1.30"	
Turbocharged Diesel Engines Enter "1.75"	

### Liters to CID Converter

Liters:	7.3
Cubic Inches:	445.4

### Vehicle Information

Model Year	99'-03'
Make	Ford
Model	F-Series
Engine Specs	V8 Diesel

<b>Based on the information entered above, the estimated CFM of the vehicle at maximum Horse Power is:</b>	<b>631</b>
--	------------

CYCLE FACTOR	
	Cycle Factor
4 Cycle Diesel and Gasoline Engine	2
2 Cycle Diesel and Gasoline Engine	1

VOLUMETRIC EFFICIENCY	
	Volumetric Efficiency (Approximate)
Naturally Aspirated Gasoline & Diesel Engines	0.8
Supercharged Diesel Engines	1.30
Turbocharged Diesel Engines	1.75

*Note: The 1.75 volumetric efficiency is applicable only at top governed engine speed under full load conditions.*

EQUATION	
The following is a method of determining approximated gasoline and diesel engine air flow requirement:	
$\text{Air Flow (CFM)} = \frac{\text{Displacement (cubic inches)}}{1728} \times \frac{\text{RPM}}{\text{Cycle Factor}} \times \text{Volumetric Efficiency}$	

EXAMPLE	
Information necessary to calculate air consumption:	
Ford F250 7.3L V8 Diesel Truck	
4 cycle, 2800 RPM, 445.4 (cubic inches) displacement, turbocharged	
$\text{Air Flow (CFM)} : \frac{445.4}{1728} \times \frac{2800}{2} \times 1.75 = 631 \text{ CFM}$
